NCE Project No. 992.04.55

Executive Summary

Nichols Consulting Engineers, Chtd. (NCE) was selected by the Fresno Council of Governments (Fresno COG) to update the Pavement Management Program (PMP) of County of Fresno ("County") using an automated survey. The purpose of the PMP is to help educate policymakers about the current condition of the road network and the impact of various scenarios on future network conditions. This report summarizes the findings from the 2024/25 PMP update.

The County is responsible for maintaining approximately 3,388.7 centerline miles of paved roads, representing a substantial investment of approximately $4.1 billion. The road network includes 446.6 centerline miles of arterial roads, 678.7 miles of collector roads, 2,070.8 miles of local roads, and 192.6 miles of other freeways or expressways (OFEs). In June 2025, NCE collected pavement condition data throughout the entire network using MTC distress protocols. Survey data were entered into the StreetSaver® database, which the County uses as a decision-support tool.

Overall, the County's pavement network is currently in "Fair" condition with an average pavement condition index (PCI) of 66. Overall, 44.5 percent of the County's road network area is in "Good" condition, approximately 33.1 percent is in "Fair" condition, 20.5 percent is in "Poor" condition, and 1.9 percent is in "Very Poor" condition.

The budget needs analysis indicated that the County needs to spend around $2.2 billion over the next 10 years to bring the road network to a condition that can be maintained with on-going preventive maintenance in the most cost-effective way. To establish a pragmatic approach, 3 budget scenarios were examined using a yearly inflation rate of 3.0 percent for a 10-year analysis period. The budgeted amounts for the 3 scenarios include paving and construction-related costs, staff time, design, construction management, and contingencies.

The following table summarizes each scenario and its corresponding 10-year budget, PCI, and deferred maintenance costs at the end of the analysis period.

Table A. Budget Scenario Analysis Summary

Scenario	Description	Annual Budget over 10-year ($M)	End of FY 34/35	
			Network PCI	Deferred Maintenance ($M)
1	County's Current Budget	90.0	49	2,501.7
2	Maintain PCI of 66	1,125.0	66	1,269.7
3	Improve PCI to 70	1,395.0	70	946.0

NCE recommends that the County increase the funding level to improve the network condition and stabilize deferred maintenance. Scenario 3 accomplishes both these objectives by increasing PCI from 66 to 70 and stabilizing the deferred maintenance at $946.0 million by the end of FY 34/35. However, if the County determines that Scenario 3 is unrealistic to implement due to significant financial commitment, **NCE recommends that the County pursue Scenario 2**. This option will maintain the current PCI of 66 throughout the analysis period, while the deferred maintenance is expected to increase to $1.3 billion by the end of FY 34/35 compared to Scenario 3. It should be noted that under Scenario 2, the required annual budget is approximately $115.0 million higher than the County's Current Budget.

1 Introduction and Background

Nichols Consulting Engineers, Chtd. (NCE) was selected by the Fresno Council of Governments (Fresno COG) to update the Pavement Management Program (PMP) of the County.

In general, PMPs are "designed to provide objective information and useful data so that managers can make more consistent, cost-effective, and defensible decisions related to the preservation of a pavement network."[1] In other words, a PMP is designed to assist cities and counties with answering questions such as:

- What does the County's pavement network include?
- What is the current condition of the pavement network?
- What are the County's current M&R strategies?
- How much funding is required to perform all needed M&R treatments over the next analysis period (typically 4 to 10 years)?
- What effect does the County's existing funding have on the network condition and overall deferred maintenance[2]?
- What effect will other funding amounts have on the network condition and deferred maintenance?

To update the County's PMP, NCE surveyed pavement condition in compliance with ASTM D6433[3]. Automated surveys were performed by two-person crews to record all pavement distresses. The surveys did not include non-pavement issues such as traffic, safety and road hazards, geometric issues, shoulders, sidewalks, curb and gutters, drainage issues, or immediate maintenance needs.

After inspection, all survey data were entered into the County's StreetSaver® database, and Pavement Condition Index (PCI) calculations were performed. NCE then reviewed and updated the County's decision tree, including maintenance and rehabilitation (M&R) strategies and treatment unit costs, analyzed the budget needs, and modeled 3 budget scenarios for the road network.

1.1 Purpose

The purpose of this report is to provide a comprehensive understanding of the overall pavement condition and facilitate effective planning and maintenance strategies for the County. The report assists policymakers in decision-making by showing the impacts of different funding strategies on the County's roads over the next 10 years. It also assists the County with identifying M&R priorities specific to the County's needs and highlights options for improving the current PCI. These options are developed by conducting "what-if" analyses using StreetSaver® software.

[1] AASHTO *Guidelines for Pavement Management Systems*. (Washington, DC: American Association of State Highway and Transportation Officials, 1990).
[2] Deferred maintenance refers to maintenance activities that were either not performed as scheduled or were postponed to a future period due to insufficient funding. This calculation encompasses costs associated with CICM (Construction Inspection and Construction Management), design, and contingencies.
[3] ASTM. *ASTM D6433. Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys.* (West Conshohocken, PA: ASTM International, 2023), astm.org.

2 Pavement Distress Data Collection

Reliable pavement data is essential for making smart, cost-effective decisions about road maintenance. High-quality information ensures that repairs are prioritized where they are needed most, resources are used efficiently, and our roads remain safe and accessible for everyone.

2.1 Pavement Condition Survey

NCE's MTC and OCTA certified inspection vehicles performed comprehensive pavement condition surveys on approximately 3388.7 centerline miles of County-maintained roads. The survey included the assessment of all functional classifications within the County's road network.

2.1.1 Automated Data Collection for Roads

Our Roadway Collection Vehicle System, which is certified by OCTA and MTC, uses a 6D Dual-lane Road LiDAR Scanner that automatically collects a wide variety of pavement defects and pavement surface damage(s) using advanced laser scanning technology to capture high resolution 3D roadway surface profiles and 2D digital pavement images. As part of this survey, 100% of the length of each road segment was surveyed. For road sections with four or more lanes, NCE conducted multiple passes (at least one in each direction) to collect sufficient data.

Our system comprises many sub-components (see Figure 1 below) to provide automated, real-time, accurate, and repeatable roadway condition results, such as:

- Inspection survey distances
- Longitudinal roughness "rideability"
- Crack detection and measurement
- 2D and 3D pavement profiles
- Wheel track rutting depths and transverse profiles
- Global positioning (GPS) system integration

The pavement distress data collection process involved the use of high-resolution 3D digital imaging technology and integrated distress laser pavement roadway scanners, which allowed us to correctly quantify the type, severity, extent, start and stop points of all ASTM D6433-20 pavement distresses.

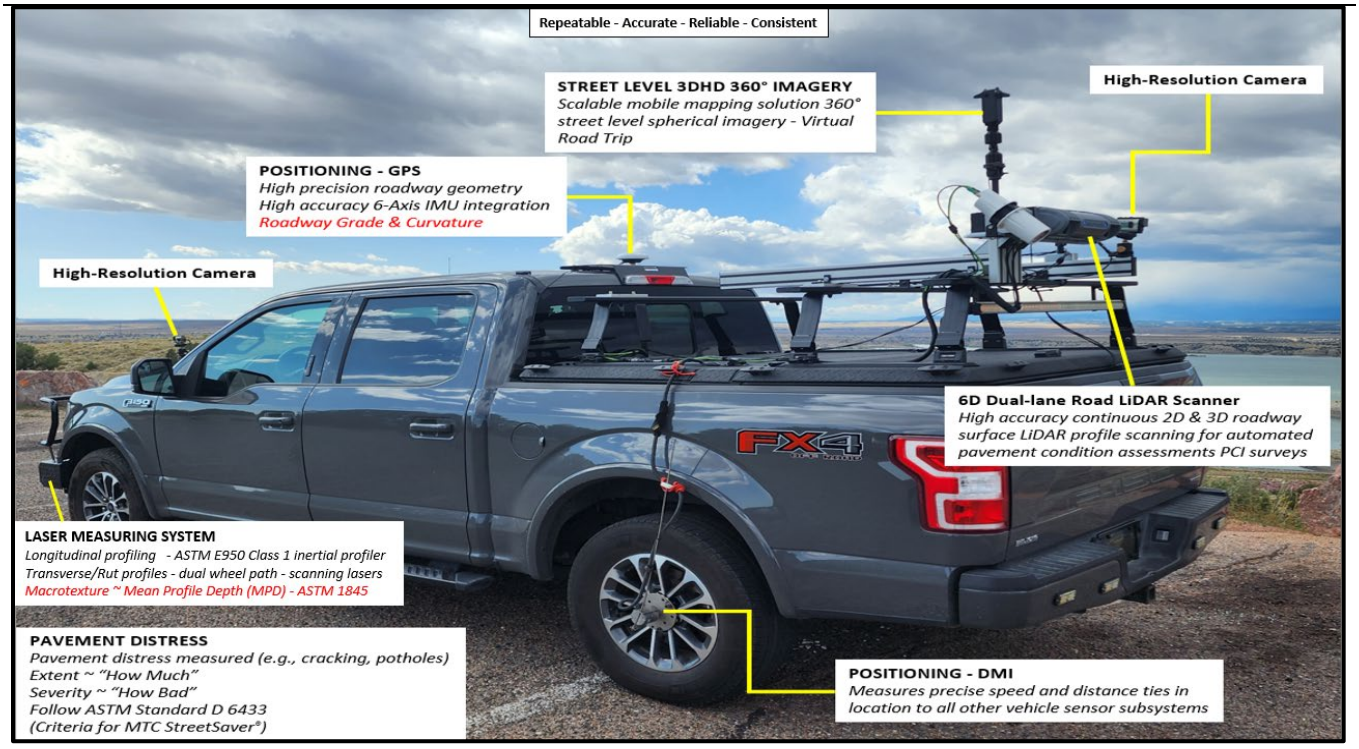

Figure 1. NCE's Data Collection Vehicle.

2.2 Quality Assurance/Quality Control

Quality management practices for pavement management suggest that a one-time inspection of the final data is typically inadequate and involves a high risk of failure. We recognize the importance of effectively implementing and maintaining quality control and assurance practices for pavement distress data. We use a proven approach that integrates quality management and control procedures throughout the entire data collection and delivery process.

NCE implemented a robust, multi-step QA/QC process for all data collection activities in the County, including multiple data verification methods, systematic quality checks, and technical validation.

2.2.1 Multiple Data Verification Methods

To ensure accuracy, several independent methods were used to verify the pavement condition data.

- **Comparison with M&R Data:** Cross-checking distress data with recent maintenance records provided by the County.
- **Historical PCI Comparison:** Typically, PCI drops by 3-5 points per year, so any sections that dropped more than that were flagged for review.
- **Desktop Review by Certified Inspectors:** Randomly selected inspections were independently reviewed by certified pavement inspectors to verify accuracy.

2.2.2 Systematic Quality Checks

NCE reviewed field procedures, compared field data with on-site conditions, and conducted random spot checks of data entry. Special attention was given to ensuring consistency between the automated road surveys and manual inspections.

2.2.3 Technical Validation

All processed data underwent final technical validation before being integrated into the PMS database. This included verification of data completeness, format consistency, and logical validation of condition values. The data collection systems were operated by certified technicians, ensuring consistency and reliability in the collected data.

2.3 Advisory Note

It should be noted that this scope of work and condition surveys did not address issues including, but not limited to traffic, safety and road hazards, geometric issues, road shoulders, sidewalks, curb and gutters, drainage issues, or short-term maintenance that should be performed.

3 Network Summary

The County is responsible for maintaining approximately 3,388.7 centerline miles of paved roads, which includes 446.6 centerline miles of arterial roads, 678.7 miles of collector roads, 2,070.8 miles of local roads, and 192.6 miles of other freeways or expressways (OFEs). The network is composed primarily of asphalt concrete (AC) pavement sections. There are 106 gravel sections, totaling about 80.0 miles, that were not surveyed and are not included in the pavement needs or budget analysis. Table 1 summarizes the road network by functional class. Appendix A lists all the roads within the network, providing details such as the road name, beginning and ending crossroads, surface type, functional classification, inspection date, and the inspected PCI.

Table 1. Network Summary Statistics by Functional Class.

Functional Class	Centerline Mileage	Percent Area	Weighted Average PCI*	Condition
Arterial	446.6	15.7%	68	Fair
Collector	678.7	22.5%	70	Good
Local	2,070.8	54.2%	63	Fair
OFEs	192.6	7.6%	72	Good
Total	**3,388.7**	**100.0%**	**66**	**Fair**
Gravel	80.0	-	-	-

*The weighted average PCI is calculated by multiplying the area of each road section by the PCI of that section, totaling all sections together, and then dividing by the total area of the network area or functional classification.

Road pavements are one of the County's most valuable assets. The total road network replacement cost is estimated to be approximately $4.1 billion. This can be viewed as the value of the pavement network and is the amount needed to fund a reconstruction of the entire paved network. The replacement cost is calculated by multiplying the total pavement area by the unit cost of reconstruction of the pavement structure. It does not include related infrastructure assets such as sidewalks, signals, markings, signs, or storm drains.

4 Pavement Condition

The PCI is a measurement of pavement grade or condition and ranges from 0 to 100. A newly constructed road will have a PCI of 100, while a road in very poor condition will have a PCI of 24 or less. Pavement conditions are primarily affected by climate, traffic loads and volumes, construction materials, and age. For asphalt pavement, distress might include:

- Alligator (Fatigue) Cracking
- Bleeding
- Block Cracking
- Bumps and Sags
- Corrugation
- Depression
- Edge Cracking
- Joint Reflection Cracking
- Lane/Shoulder Drop-Off
- Longitudinal/Transverse Cracking
- Patching and Utility Cut Patching
- Polished Aggregate
- Potholes
- Railroad Crossing
- Rutting
- Shoving
- Slippage Cracking
- Swell
- Raveling
- Weathering

The photographs in Figure 2 illustrate examples of asphalt concrete roads with different PCI ranges.

Figure 2. Examples of Roads with Different PCIs.

The definitions of the pavement condition categories and PCI ranges are shown in Table 2. These are the PCI "breakpoints" in StreetSaver®.

Table 2. Pavement Condition Categories.

Condition Category	PCI Range	Description
Good	70 – 100	Pavements with minimal surface distress that may include some hairline longitudinal/transverse cracks and/or weathering. The pavement structure is sound, and minor oxidation may occur.
Fair	50 – 69	Pavements with significant distress that is predominantly non-load-related, such as longitudinal/transverse cracks, bleeding, block cracking, weathering, raveling, etc. The pavement structure is sound, and some oxidation has occurred.
Poor	25 – 49	Pavements with moderate to severe surface distresses. Extensive weathering or raveling, block cracking, and load-related distresses such as alligator cracking, rutting, and potholes may occur.
Very Poor	0 – 24	Pavements with severe weather-related distress and large quantities of load-related distress. These pavements are nearing the end of their service life.

4.1 County's Current Pavement Condition

The County's current overall weighted average PCI for the network is 66, which places the overall road network pavement condition in the "Fair" category. Figure 3 shows the PCIs for roads network with different functional classifications. Road condition assessments by functional class indicate total network that 44.5% are categorized as 'Good,' 33.1% as 'Fair,' 20.5% as 'Poor,' and 1.9% as 'Very Poor'.

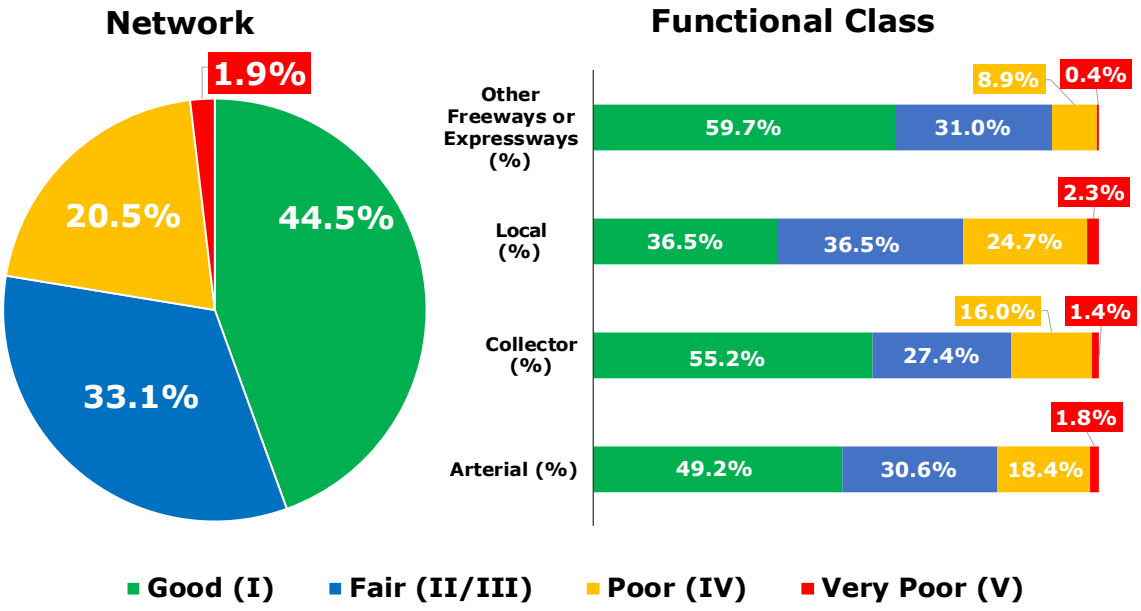

Figure 3. Road Network Percent Pavement Area by Condition Category.

4.2 PCI Comparison with Neighboring Agencies

Figure 4 shows the County's average network PCI compared to neighboring agencies as well as the statewide average PCI from the 2022 California Statewide Local Streets and Roads Needs Assessment[4]. The County's PCI of 66 positions the County one point above the 2022 statewide average of 65.

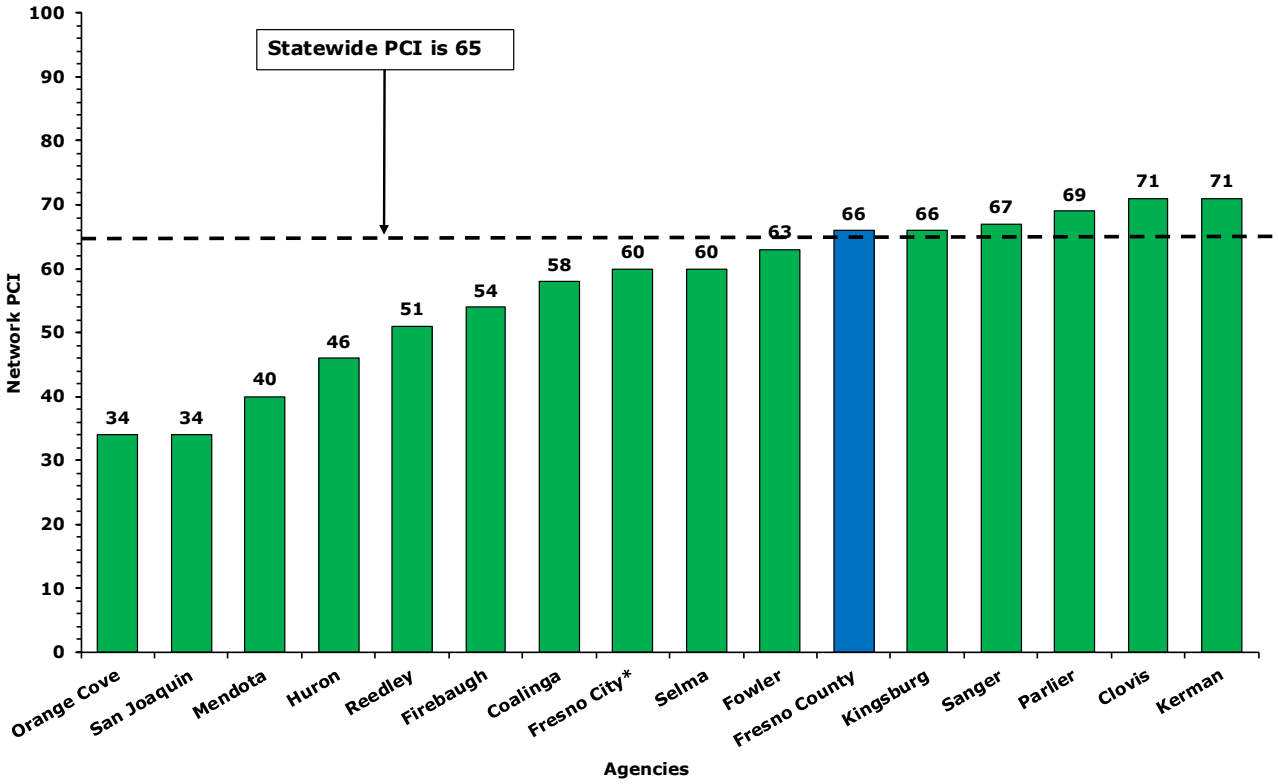

Figure 4. Network PCI for Different Agencies.

[4] "California Statewide Local Streets and Roads Needs Assessment 2022 Update". Nichols Consulting Engineers, Chtd., CA, 2022.

5 Maintenance and Rehabilitation Strategies

In general, surface treatments such as crack seals or slurry seals are used when the pavements are in "Fair" to "Good" condition. This type of treatment is usually considered "preventive maintenance". When the pavement condition deteriorates to lower levels, overlays and full-depth structure replacements must be performed. These are considered "rehabilitation" or "reconstruction". In addition, base repairs for more localized distresses are commonly done in preparation for overlay and slurry seal treatments.

Based on a discussion with County staff, a detailed M&R decision tree was prepared and is included in Appendix B. Figure 5 presents the decision tree of arterials. This determined the most effective and realistic treatments for each group of roads by functional class and condition category.

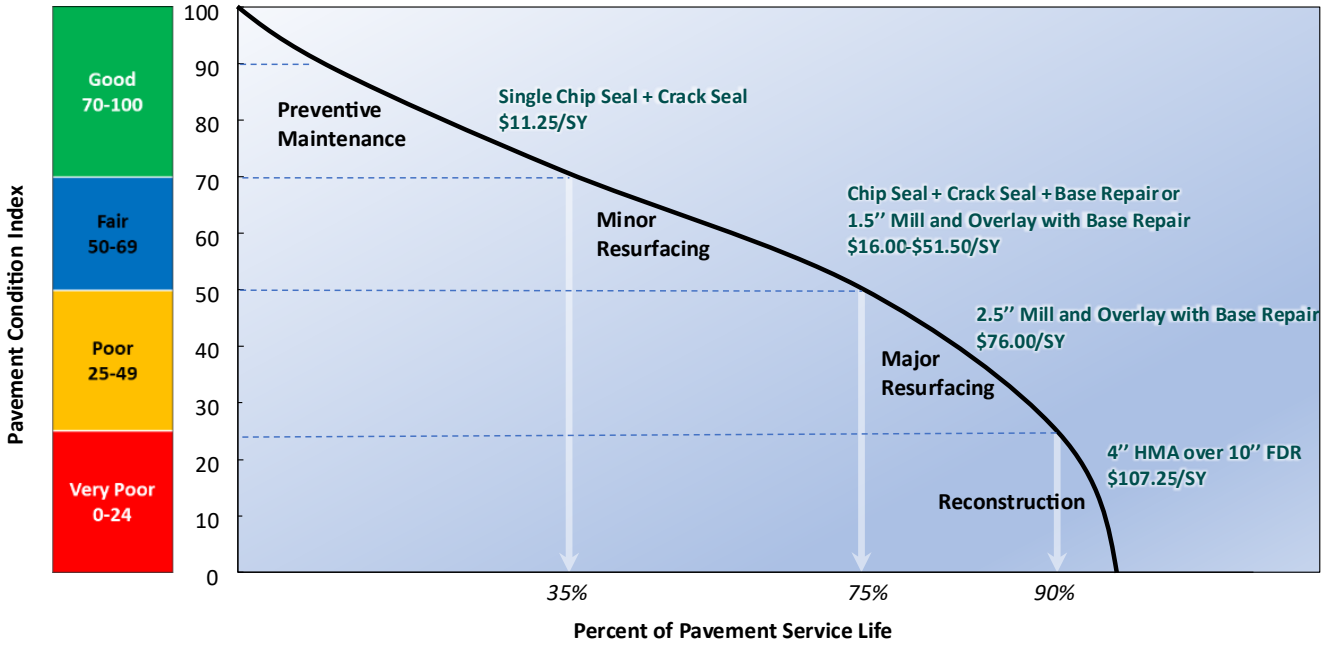

Figure 5. Costs[5] of Maintaining Service Life (Arterial).

Figure 5 illustrates how costs of pavement treatment increase as pavement conditions decrease over time. The dollar amounts shown in Figure 5 are based on recent bids received by the County and illustrate that it costs much less to maintain Arterials in good condition than to repair failed roads. By letting pavements deteriorate, roads that once cost about $11.25 per square yard to treat with single chip seal may, in a few years, cost about $107.25 per square yard to reconstruct. Note that a single chip seal can be applied on approximately 9 times as many lane miles as those requiring reconstruction for pavements in failed condition.

Because of this, a key pavement management repair strategy is to keep roads in "Good" to "Fair" condition from deteriorating. This is particularly true for roads in the "Fair" range since pavement deterioration will accelerate if left untreated. Pavements in "Fair" condition show some distress and require more than preventive

[5] In addition to the contractor's prices, unit costs are loaded to include staff time, design, construction management, contingencies, and non-asphalt concrete related work.

maintenance. At this point, a well-designed pavement will have reached between 35 and 50 percent of its life, and a thick overlay with fabric would be required to bring its condition back to “Good.” For pavements in the “Poor” category, approximately 30 percent of service life is left, and a thicker grind and overlay (2.5 to 4.0 inches) would be required to bring its condition back to “Good”. Pavements in “Very Poor” condition are near the ends of their service lives and often exhibit severe forms of distress such as potholes, rutting, and extensive cracking. At this stage, reconstruction is typically required.

6 Budget Analysis

Based on the principle that it costs less to maintain roads in good condition than it does to repair those that have failed, cost-effective PMPs employ strategies that first eliminate deferred maintenance and then preserve the network with ongoing preventive maintenance. Such strategies bring the network condition to an optimal PCI that can be maintained over time.

6.1 Budget Needs

The first step in developing a cost-effective strategy is to determine, assuming an unconstrained budget, the total maintenance budget "needs" of the network, i.e., the funding required for every road in the network to reach optimal conditions based on the policy established in the decision tree. For the County, the cost of treatment(s) over the analysis period was calculated by multiplying unit costs by pavement section area at an annual inflation rate of 3.0 percent over a 10-year analysis period.

The budget needs are estimated to be approximately $2.2 billion until the end of FY 34/35. Of the total budget needs, approximately $1.5 billion (68.6 percent) would be devoted to rehabilitation, while the rest would be allocated for preventive maintenance. If the County follows this "ideal" strategy, the average network PCI will increase to 82 by FY 34/35. Table 3 below shows the impacts of expenditures on the PCI, assuming an unconstrained budget. Appendix C presents the following information regarding the budget needs: projected PCI, cost summary, and a summary of the preventive and rehabilitation maintenance treatments.

Table 3. Budget Needs.

Fiscal Year	Current	25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total
Total Budget Needs ($M)	N/A	883.4	100.1	95.2	69.5	161.9	67.9	90.7	164.2	402.6	127.4	2,162.9
Rehabilitation ($M)	N/A	809.3	89.5	59.8	20.1	109.9	17.0	52.5	96.0	166.1	64.5	1,484.7
Preventive Maintenance ($M)	N/A	74.1	10.6	35.4	49.4	52.0	50.9	38.2	68.2	236.5	62.9	678.2
Treated PCI	66	86	82	81	80	83	80	79	80	84	82	N/A
Untreated PCI	66	66	65	63	60	58	55	53	50	48	46	N/A

6.2 Budget Scenarios

Having determined the road network's maintenance needs, the next step in developing a cost-effective M&R strategy is to generate several alternative budgets and analyze “what-if” scenarios. By examining the impacts of budget scenarios, the advantages and disadvantages of different funding levels and maintenance strategies can be illustrated.

The budgeted amounts for the 3 scenarios (noted below) include an inflation factor of 3.0 percent over a 10-year analysis period. They also include paving and construction-related costs (mobilization, traffic control, striping, etc.), staff time, design, construction management, and contingencies:

- Scenario 1: County’s Current Budget ($10.0M/year)
- Scenario 2: Maintain Current PCI of 66 ($125.0M/year)
- Scenario 3: Improve PCI to 70 ($155.0M/year)

6.2.1 Scenario 1: County's Current Budget ($10.0M/year)

At the County's anticipated budget of $10.0 million annually, the network PCI will decrease from 66 to 49 by FY 34/35. Scenario 1 allocated an average of 30.0 percent of the budget towards preventive maintenance. By the end of the analysis period, 26.3 percent of the network will be in "Good" condition, 25.4 percent will be in "Fair" condition, 27.1 percent will be in "Poor" condition, and 21.2 percent will be in "Very Poor" condition. The deferred maintenance cost will increase from $883.4 million to about $2.5 billion by FY 34/35. Table 4 and Figure 6 show the outcomes under this scenario. A list of sections selected for treatment is provided in Appendix E. The treatments are selected based on the projected PCI for the treatment year, which is shown as "PCI Before" in Appendix E.

Table 4. Cost Summary for Scenario 1.

Fiscal Year	Current	25/26*	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total
County's Budget ($M)	N/A	$-	$10.0	$10.0	$10.0	$10.0	$10.0	$10.0	$10.0	$10.0	$10.0	90
Deferred Maintenance ($M)	$883.4	$883.4	$1,026.8	$1,193.3	$1,354.1	$1,532.6	$1,705.6	$1,898.1	$2,095.5	$2,299.5	$2,501.7	N/A
Network PCI	66	66	65	63	61	59	57	55	53	51	49	N/A

**Assumed the County has spent FY 25/26 budget before inspection.*

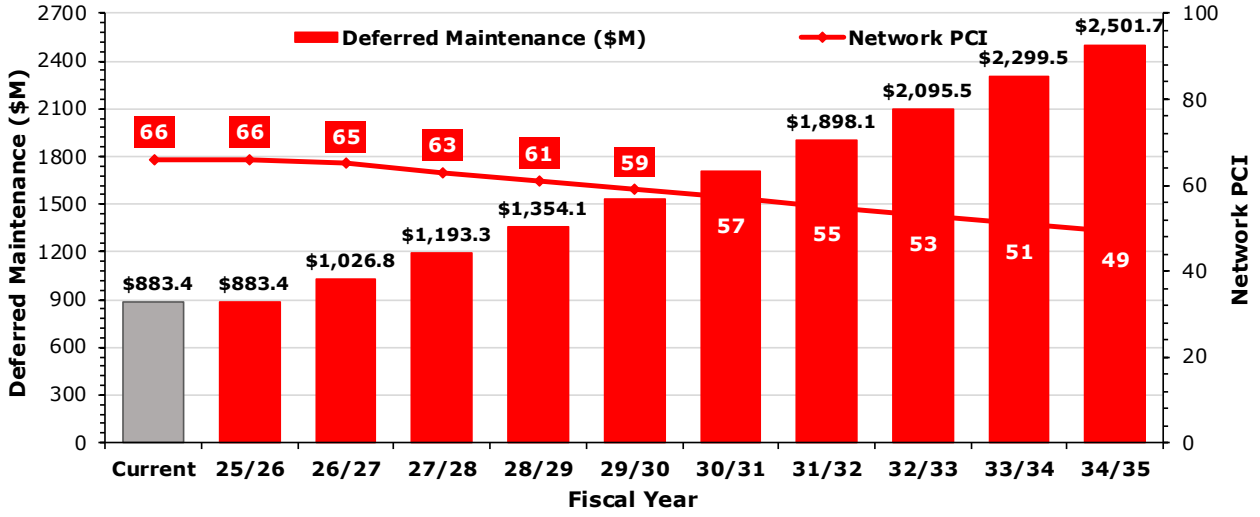

Figure 6. PCI versus Deferred Maintenance for Scenario 1.

6.2.2 Scenario 2: Maintain Current PCI of 66 ($125.0M/year)

In this scenario, the goal is to maintain PCI of 66 for the network by the end of FY 34/35. As shown in Table 5 and Figure 7 for Scenario 2, the estimated financial commitment required to accomplish this goal is having a budget of $125.0 million annually over 10 years. Scenario 2 allocated an average of 26.0 percent of the budget towards preventive maintenance. As a result, the deferred maintenance cost will increase to about $1.3 billion by FY 34/35. In this scenario, 64.0 percent of the network will be in "Good" condition, 11.0 percent will be in "Fair" condition, 8.5 percent will be in "Poor" condition, and 16.5 percent will be in "Very Poor" condition after 10 years.

Table 5. Cost Summary for Scenario 2.

Fiscal Year	Current	25/26*	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total
County's Budget ($M)	N/A	$-	$125.0	$125.0	$125.0	$125.0	$125.0	$125.0	$125.0	$125.0	$125.0	$1,125.0
Deferred Maintenance ($M)	$883.4	$883.4	$911.8	$959.9	$998.8	$1,045.6	$1,104.7	$1,137.7	$1,175.4	$1,205.1	$1,269.7	N/A
Network PCI	66	66	68	67	67	66	66	66	66	66	66	N/A

**Assumed the County has spent FY 25/26 budget before inspection.*

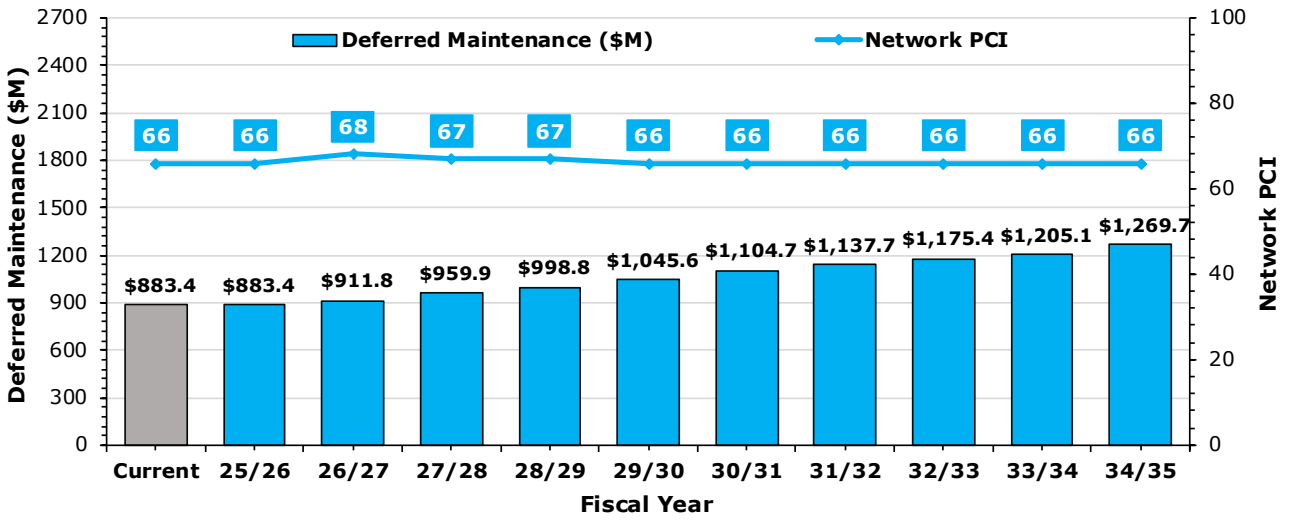

Figure 7. PCI versus Deferred Maintenance for Scenario 2.

6.2.3 Scenario 3: Improve PCI to 70 by FY 34/35 ($155.0M/Year)

This scenario assumes the County will increase network PCI to 70 by the end of FY 34/35. As shown in Table 6 and Figure 8, the estimated budget for this is $155 million annually over 10 years. In this scenario, 20.0 percent of the budget will be used for preventive maintenance, and the deferred maintenance cost would be increased to $946.0 million by FY 34/35. In this scenario, 72.0 percent of the network will be in "Good" condition, 11.0 percent in "Fair" condition, 2.0 in "Poor" condition, and 15.0 percent in "Very Poor" condition at the end of the 10-year period.

Table 6. Cost Summary for Scenario 3.

Fiscal Year	Current	25/26*	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	Total
County's Budget ($M)	N/A	$-	$155.0	$155.0	$155.0	$155.0	$155.0	$155.0	$155.0	$155.0	$155.0	$1,395.0
Deferred Maintenance ($M)	$883.4	$883.4	$881.8	$899.0	$907.5	$922.2	$945.4	$938.8	$937.1	$923.4	$946.0	N/A
Network PCI	66	66	69	68	69	69	69	69	69	70	70	N/A

**Assumed the County has spent FY 25/26 budget before inspection.*

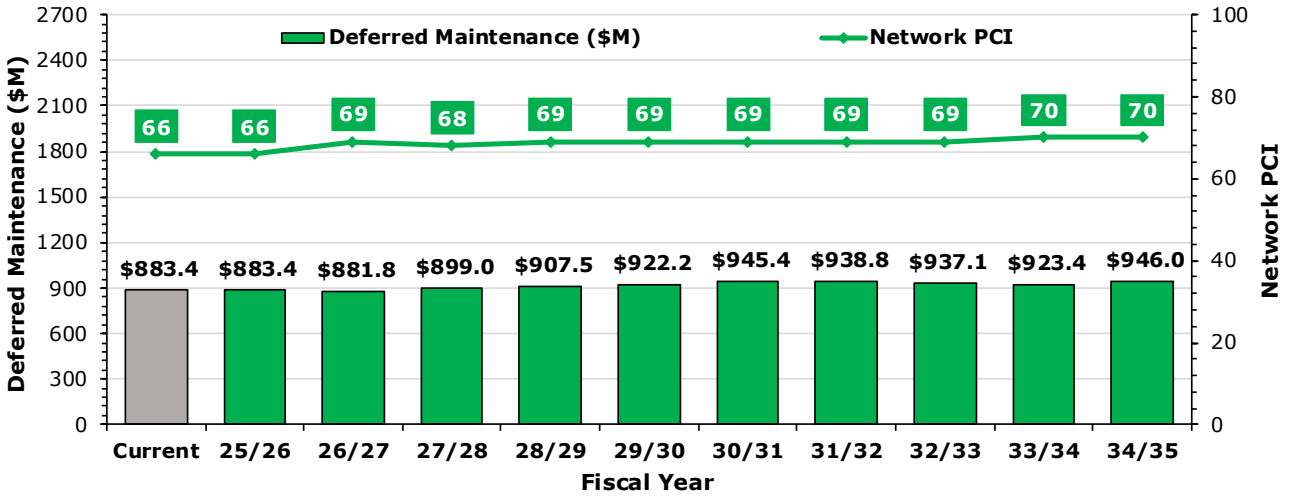

Figure 8. PCI versus Deferred Maintenance for Scenario 3.

6.3 Scenario Summary and Comparisons

Scenario 1: County's Current Budget ($10.0M/year) – The network PCI is projected to decrease from 66 to 49 by the end of the 10-year analysis period. The cost of deferred maintenance[6] will increase from $883.4 million to $2.5 billion by FY 34/35.

Scenario 2: Maintain Current PCI of 66 ($125.0M/year) – This scenario assumes that the County will allocate $125.0 million each year on average to maintain the PCI at 66 by the end of FY 34/35. This will cost around $1.1 billion total over 10 years. Deferred maintenance costs will increase to $1.3 billion by FY 34/35.

Scenario 3: Improve PCI to 70 by FY 34/35 ($155.0M/year) – This scenario assumes that the County will increase the network PCI to 70, the Fresno COG goal. This will cost around $1.4 billion annually over 10 years. Deferred maintenance costs will be increased to $946.0 million by FY 34/35.

The following table summarizes each scenario and its corresponding 10-year budget, PCI, and deferred maintenance costs at the end of the analysis period. Appendix D shows the cost and network condition summary for each scenario and Appendix F shows the current PCI conditions in FY25/26 and after treatment in FY 34/35 for each scenario.

Table 7. Budget Scenario Analysis Summary.

Scenario	Description	Annual Budget over 10-year ($M)	End of FY 34/35	
			Network PCI	Deferred Maintenance ($M)
1	County's Current Budget	90.0	49	2,501.7
2	Maintain PCI of 66	1,125.0	66	1,269.7
3	Improve PCI to of 70	1,395.0	70	946.0

Figure 9 compares the annual changes in PCI under each budget scenario, and Figure 10 illustrates the associated annual changes in deferred maintenance under each budget scenario. Under Scenario 1, PCI is projected to decrease by approximately 2 point per year. In contrast, under Scenarios 2 and 3, PCI either remains constant at its current level or increases by 1 or 2 points (Figure 9). For Scenarios 3, the PCI will increase to 70, the goal PCI of Fresno COG. In addition, as seen in Figure 10, deferred maintenance is projected to increase by an average of $161.8 million annually under Scenario 1, an average of $38.6 million annually under Scenario 2, and an average $6.3 million of under Scenario 3.

[6] Deferred maintenance refers to maintenance activities that were either not performed as scheduled or were postponed to a future period due to insufficient funding. This calculation encompasses costs associated with CICM (Construction Inspection and Construction Management), design, and contingencies.

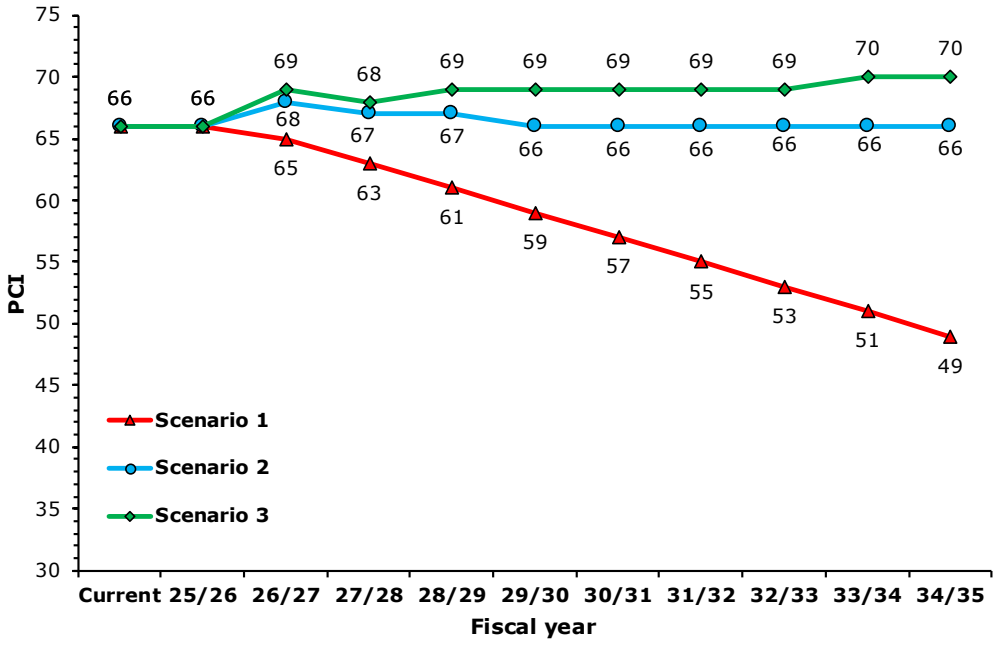

Figure 9. Comparison of Annual PCI by Scenario.

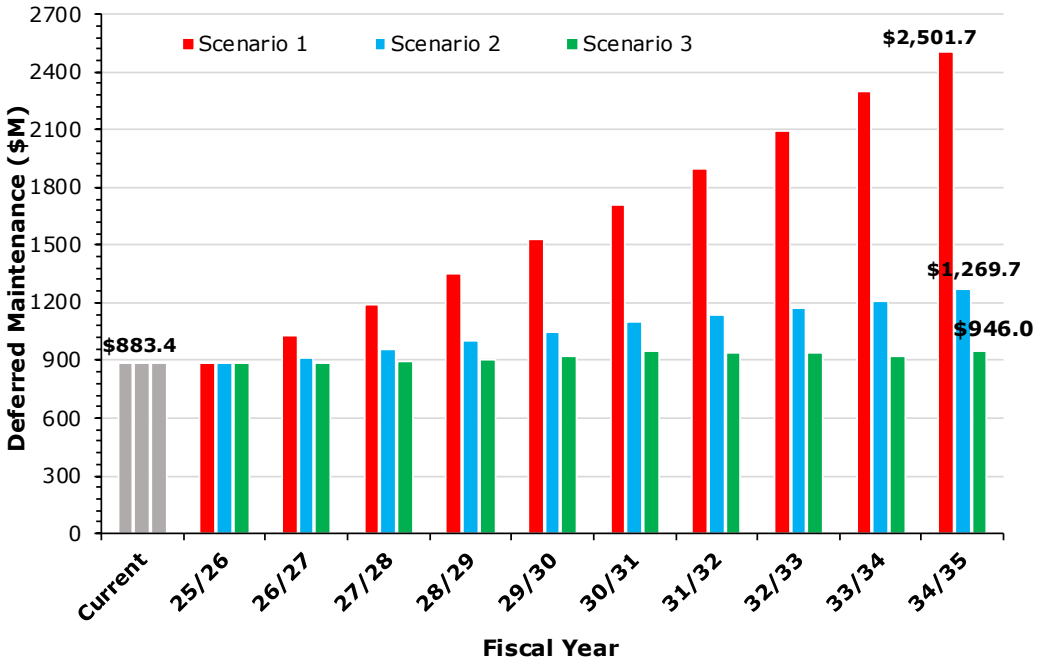

Figure 10. Comparison of Annual Deferred Maintenance by Scenario.

Figure 11 illustrates the percentage change in pavement conditions for each scenario at the end of FY 34/35. Scenario 2 and Scenario 3 will significantly increase the proportion of the network in the "Good" condition with less portion in the "Poor" condition, compared with Scenario 1. In contrast, Scenario 1 will have a drop in the portion of the network in “Good” condition and in “Fair” condition due to limited budget. In Scenario 2 and Scenario 3, the proportion of the network in the "Very Poor" condition will increase, which h Scenario 2 has a higher percentage.

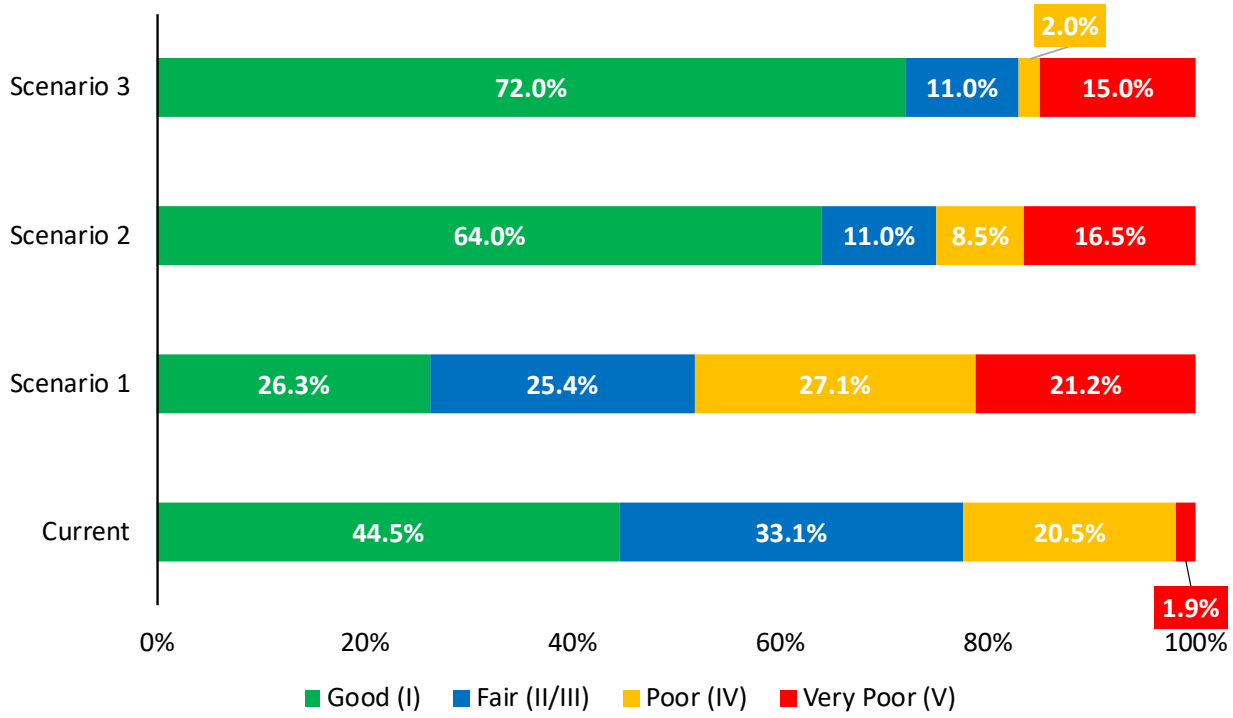

Figure 11. Comparison of Pavement Condition by FY 34/35 by Scenarios.

It is important to note that to improve the network condition and reduce the deferred maintenance, the County will need to increase the annual budget significantly. Scenarios 2 and 3 will require an average of $115 million and $145.0 million more per year, respectively, compared to Scenario 1.

7 Conclusions and Recommendations

The County has made a substantial investment of $4.1 billion in its pavement network. Overall, the pavement network is in the "Poor" condition with a PCI of 66. The County's existing annual budget (Scenario 1) of $10 million over 10 years is expected to reduce the overall network PCI from 66 to 49. Under Scenario 2, PCI would remain at 66 by FY 34/35 with an investment of $125 million annually. Under Scenario 3, PCI would increase to 70, by FY 34/35 with an investment of $155 million annually, reaching the PCI goal of Fresno COG.

7.1 Recommendations

NCE recommends that the County increase the funding level to improve the network condition and stabilize deferred maintenance. Scenario 3 accomplishes both these objectives by increasing PCI from 66 to 70 and stabilizing the deferred maintenance at $946.0 million by the end of FY 34/35. However, if the County determines that Scenario 3 is unrealistic to implement due to significant financial commitment, **NCE recommends that the County pursue Scenario 2** (included in Appendix E) considering the following:

1. **Additional Funding –** Actively pursue additional pavement funding sources to fill the gap between the County's existing funding and Scenario 3. Here are some potential sources of funding the County can pursue:

   Federal Funding Sources

   - Congestion Mitigation and Air Quality Improvement Program (CMAQ)
   - Highway Safety Improvement Program (HSIP)
   - Bipartisan Infrastructure Investment and Jobs Act (IIJA)
   - Regional Surface Transportation Program (RSTP)
   - Surface Transportation Program (STP)
   - Demo-High Priority Projects Program
   - Highway Bridge Program (HBP)

   State Funding Sources

   - Active Transportation Program (ATP), which now includes the Bicycle Transportation Account (BTA) and Safe Routes to Schools (SR2S)
   - State Transportation Improvement Program (STIP)
   - State SB1 Local Partnership Program (LPP)

   Local/Regional Funding Sources

   - General funds
   - Local sales tax measures
   - Transportation mitigation fees

2. **Pavement Maintenance Strategies –** Continue with a well-funded preventive maintenance program to preserve the good roads in "Fair" condition and rehabilitation projects to improve pavements in poor condition. This is necessary to maintain at least the portion of the road network in "Fair" condition and avoid increasing the deferred maintenance.
3. **Inspection Strategies –** Monitor future pavement performance and ongoing maintenance needs by updating the required inventory of the County's collector roads every 2 to 3 years at a minimum. NCE recommends that the County also inspect the local road network every 4 to 5 years.
4. **M&R Decision Tree –** Review and update the M&R treatment strategies and associated unit costs annually to reflect new construction techniques and costs so that the budget analysis results remain reliable and accurate.

Appendix A

Section Description Inventory – Average (Weighted by Area) PCI

Section Description Inventory Report

This report lists a variety of section description information for each of the County's road pavement sections. It lists the road and section identifiers, limits, functional class (FC), surface type, number of lanes, lengths, widths, and inspected PCI.

All of the County's vehicular road sections are included in the report. The report is sorted alphabetically by Street Name and Section ID and by descending PCIs. The field descriptions in this report are listed on the next page.

Header	Description
Street ID	Road identification in StreetSaver® unique for each road
Road Name	The name of the road as indicated by road signs in the field
Section ID	Section identification number in StreetSaver® unique for each section of one road
Beg Location	Beginning limit of the section
End Location	Ending limit of the section
Functional Class	Functional Classification (A - Arterial, C - Collector, L - Local, OFE - Other Freeways or Expressways, MaC - Major Collector, MiA - Minor Arterial, RPA - Rural Principal Arterial-Other)
Surface Type	Surface Type (AC = Asphalt Concrete, AC/AC = Asphalt Concrete Overlay of existing Asphalt Concrete, ST = Surface Treatment, G = Gravel)
Lanes	Number of lanes of the section
Length (ft)	Length of the section in feet
Width (ft)	Average width of the section in feet
Area (sf)	Area of the section in square feet
PCI	Average Inspected PCI for the section
Condition Category	"Very Good" = PCI > 70, "Good" = PCI > 50 & < 70, "Poor" = PCI > 25 & < 50, "Very Poor" = PCI < 25

Maintenance and Rehabilitation (M&R) Decision Tree

Maintenance and Rehabilitation (M&R) Decision Tree

This report presents the current maintenance and rehabilitation decision tree that exists in the database. The decision tree forms the basis for all of the budgetary computations included in this report. ***Changes to the decision tree will make the results in the budget reports invalid.*** All pavement treatment unit costs relevant to the road types in the database were updated.

The decision tree lists the treatments and costs selected for preventive maintenance and rehabilitation activities. Each line represents a specific combination of functional classification and surface type.

The preventive maintenance portion of the report is identified as Condition Category I – Very Good. All preventive maintenance treatment listings are assigned only to sections in Condition Category I where the PCI ≥ 70. Sections with PCI values less than 70 are assigned to treatments listed in Categories II through V.

In the preventive maintenance category (PCI ≥ 70), a time sequence is used to identify the appropriate treatment and cost. Each preventive maintenance treatment description consists of three parts: 1) a CRACK treatment, 2) a SURFACE treatment, and 3) a RESTORATION treatment. These three parts allow the user to specify one of three different preventive maintenance treatments depending on the prior maintenance history of the section.

1. The CRACK treatment part can be used to specify the most frequent type of preventive maintenance activity planned (typically crack seals).
2. The SURFACE treatment part can be used to specify more extensive and less frequent preventive maintenance activities, such as chip seals or slurry seals. For example, a crack seal can be specified on a 3-year cycle with a slurry seal specified after 5 years.
3. The RESTORATION part can be used to specify a surface restoration treatment (such as an overlay) to be performed after a specified number of surface treatments. For example, after a certain number of successive slurry seals, an overlay can be specified instead of another slurry seal.

Rehabilitation treatments are assigned to sections in Condition Categories II through V (PCI less than 70). Each line is defined by a specific combination of functional classification, surface type, and condition category.

COLUMN	DESCRIPTION
Functional Class	Functional Classification identifying the branch
Surface	Surface Type identifying the branch number.
Condition Category	Condition Category (I through V).
Treatment Type	First Row (Crack Treatment) indicates localized treatment (e.g., crack sealing). Second Row (Surface Treatment) indicates surface treatment (e.g., slurry sealing). Third Row (Restoration Treatment) indicates surface restoration (e.g., overlay).
Treatment	Name of treatments from the "Treatment Descriptions" report.
Yrs. Between Crack Seals	First Row - number of years between successive treatment applications specified in the first row (i.e., CRACK treatment).
Yrs. Between Surface Seals	Second Row - number of years between successive treatment applications specified in the second row (i.e., SURFACE treatment).
Number of Sequential Seals	Number of times that the treatment application in the second row (i.e., SURFACE treatment) will be performed prior to performing the treatment application in the third row.

Note that the treatments assigned to each section should not be blindly followed in preparing a road maintenance program. Engineering judgment and project level analysis should be applied to ensure that the treatment is appropriate and cost effective for the section.

Fresno County

Appendix C

Budget Needs

Budget Needs Reports

The purpose of this section is to answer the question: ***If the County had all the money in the world, what sections should be fixed and how much will it cost?*** Based on the Maintenance & Rehabilitation (M&R) decision tree and the PCIs of the sections, the program will then select a maintenance or rehabilitation action and compute the total costs over a period of ten years. The Budget Needs represents the "ideal world" funding levels, while the Budget Scenario reports in the next section represent the most "cost effective" prioritization possible for the actual funding levels.

A budget needs analysis has been performed. The summary results from the analysis are shown below. An interest rate of 3% and an inflation factor of 3% were used to project the costs for the next ten years. This report shows the total ten-year budget that would be required to meet the County standards as exemplified in the M&R decision tree.

Budget Needs reports included in this appendix are listed below:

- Projected PCI/Cost Summary
- Preventive Maintenance Treatment/Cost Summary
- Rehabilitation Treatment/Cost Summary
